

6.4.2. Water Reuse Measurement

Using both treated and alternative water sources, Tarlac Agricultural University (TAU) actively monitors water reuse throughout the campus. TAU reported using roughly 162,985.40 cubic meters of water overall between October 2021 and September 2022, of which 22.03% came from treated water supplied by Primewater Infrastructure Corporation. The university kept up these tracking efforts in 2023, taking into consideration groundwater extraction, rainwater collected in its ten small water reservoirs, water from treated supplies, and more rain-harvesting tanks. These thorough measurements demonstrate TAU's dedication to the prudent management and reuse of water resources.
